Layout database

The LHC Reference Database is designed to store all data pertaining to the collider, its components, their layout, their manufacturing as a large unified tool.

Samy CHEMLI and team

It covers

Beam Instrumentation

Collimators and Aperture Limiters,

Cryomagnets and Warm Magnets,

Distribution Feed Boxes and Current Leads,

Injection and Beam Dumps,

Power Converters,

RF System,

Vacuum

Cables and Cable Trays,

Cooling and Ventilation,

Electronic racks,

Tunnel Cryogenic System

Monorail,

Space Reserved for Alignment,

Space Reserved for Transport,

Steel Structures,

Tunnel Geometry (floor height, local geometry, drain covers).

It is source number 1

FESA

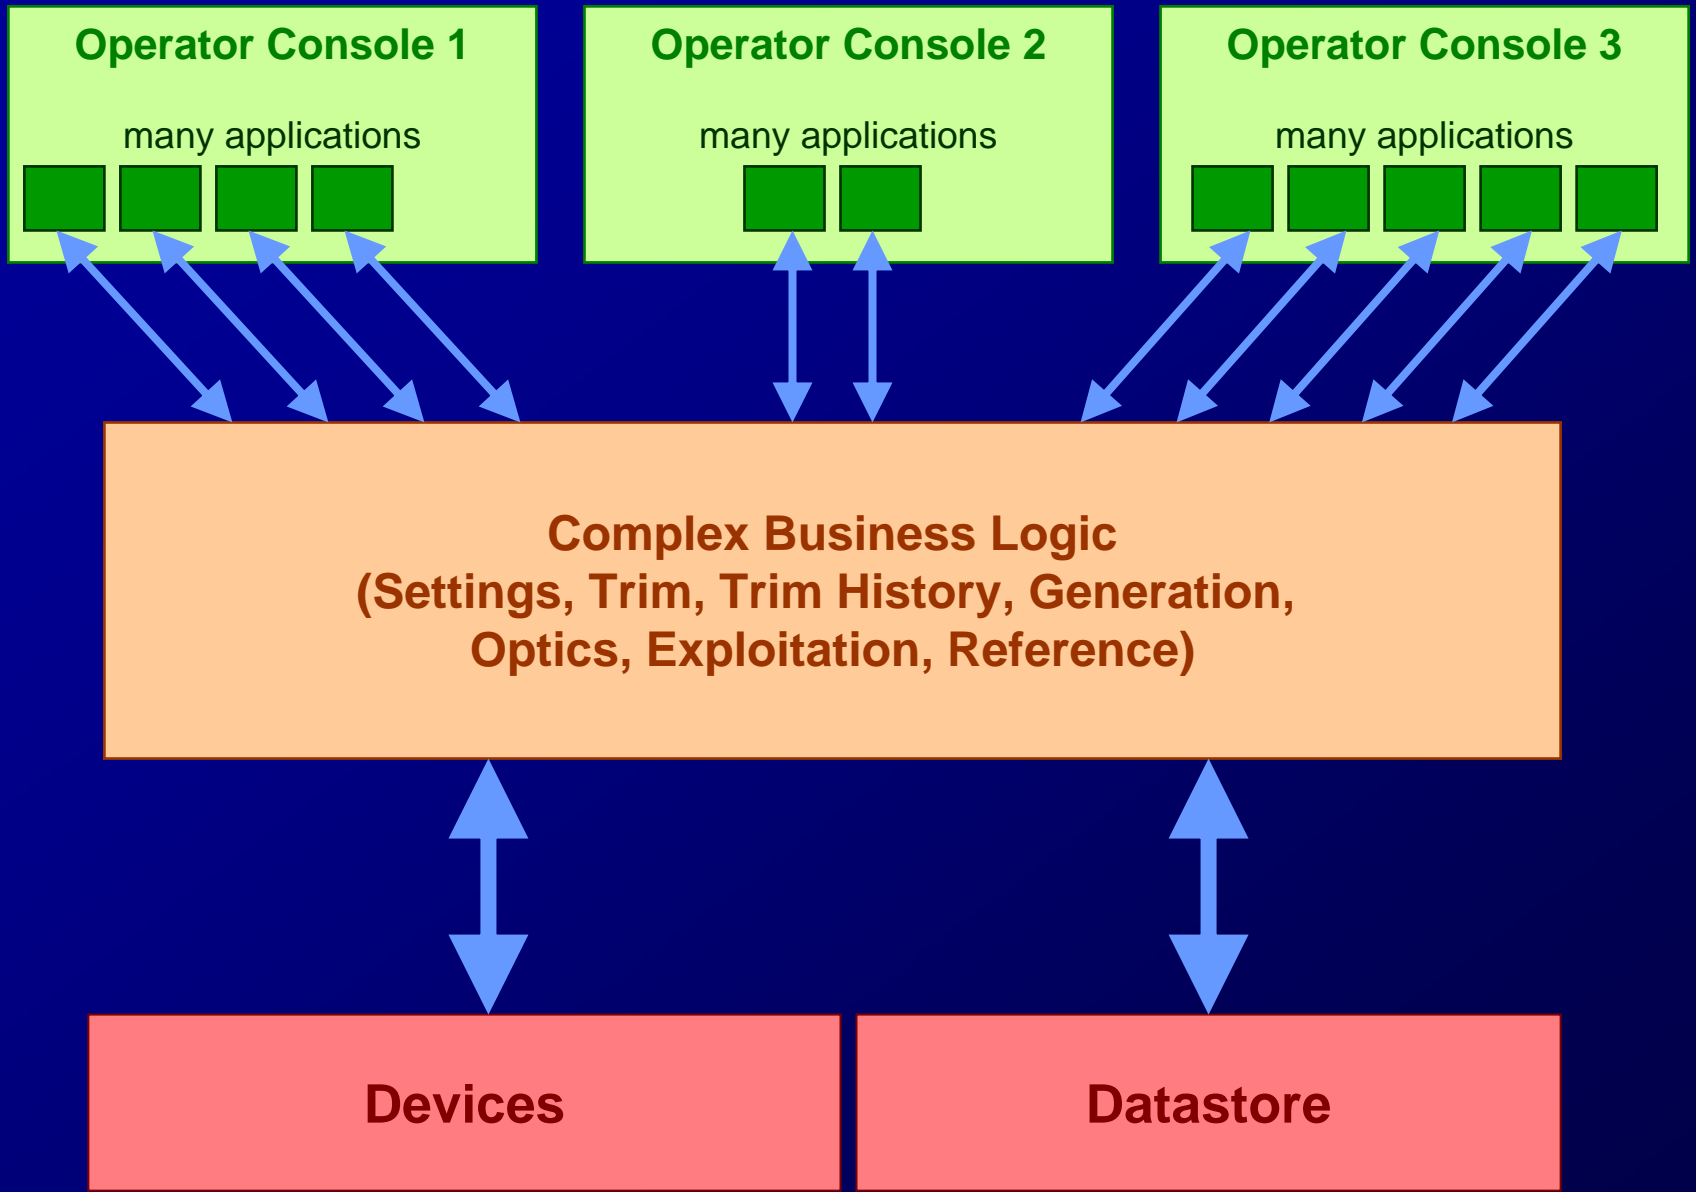

The source of all FESA devices and their properties.

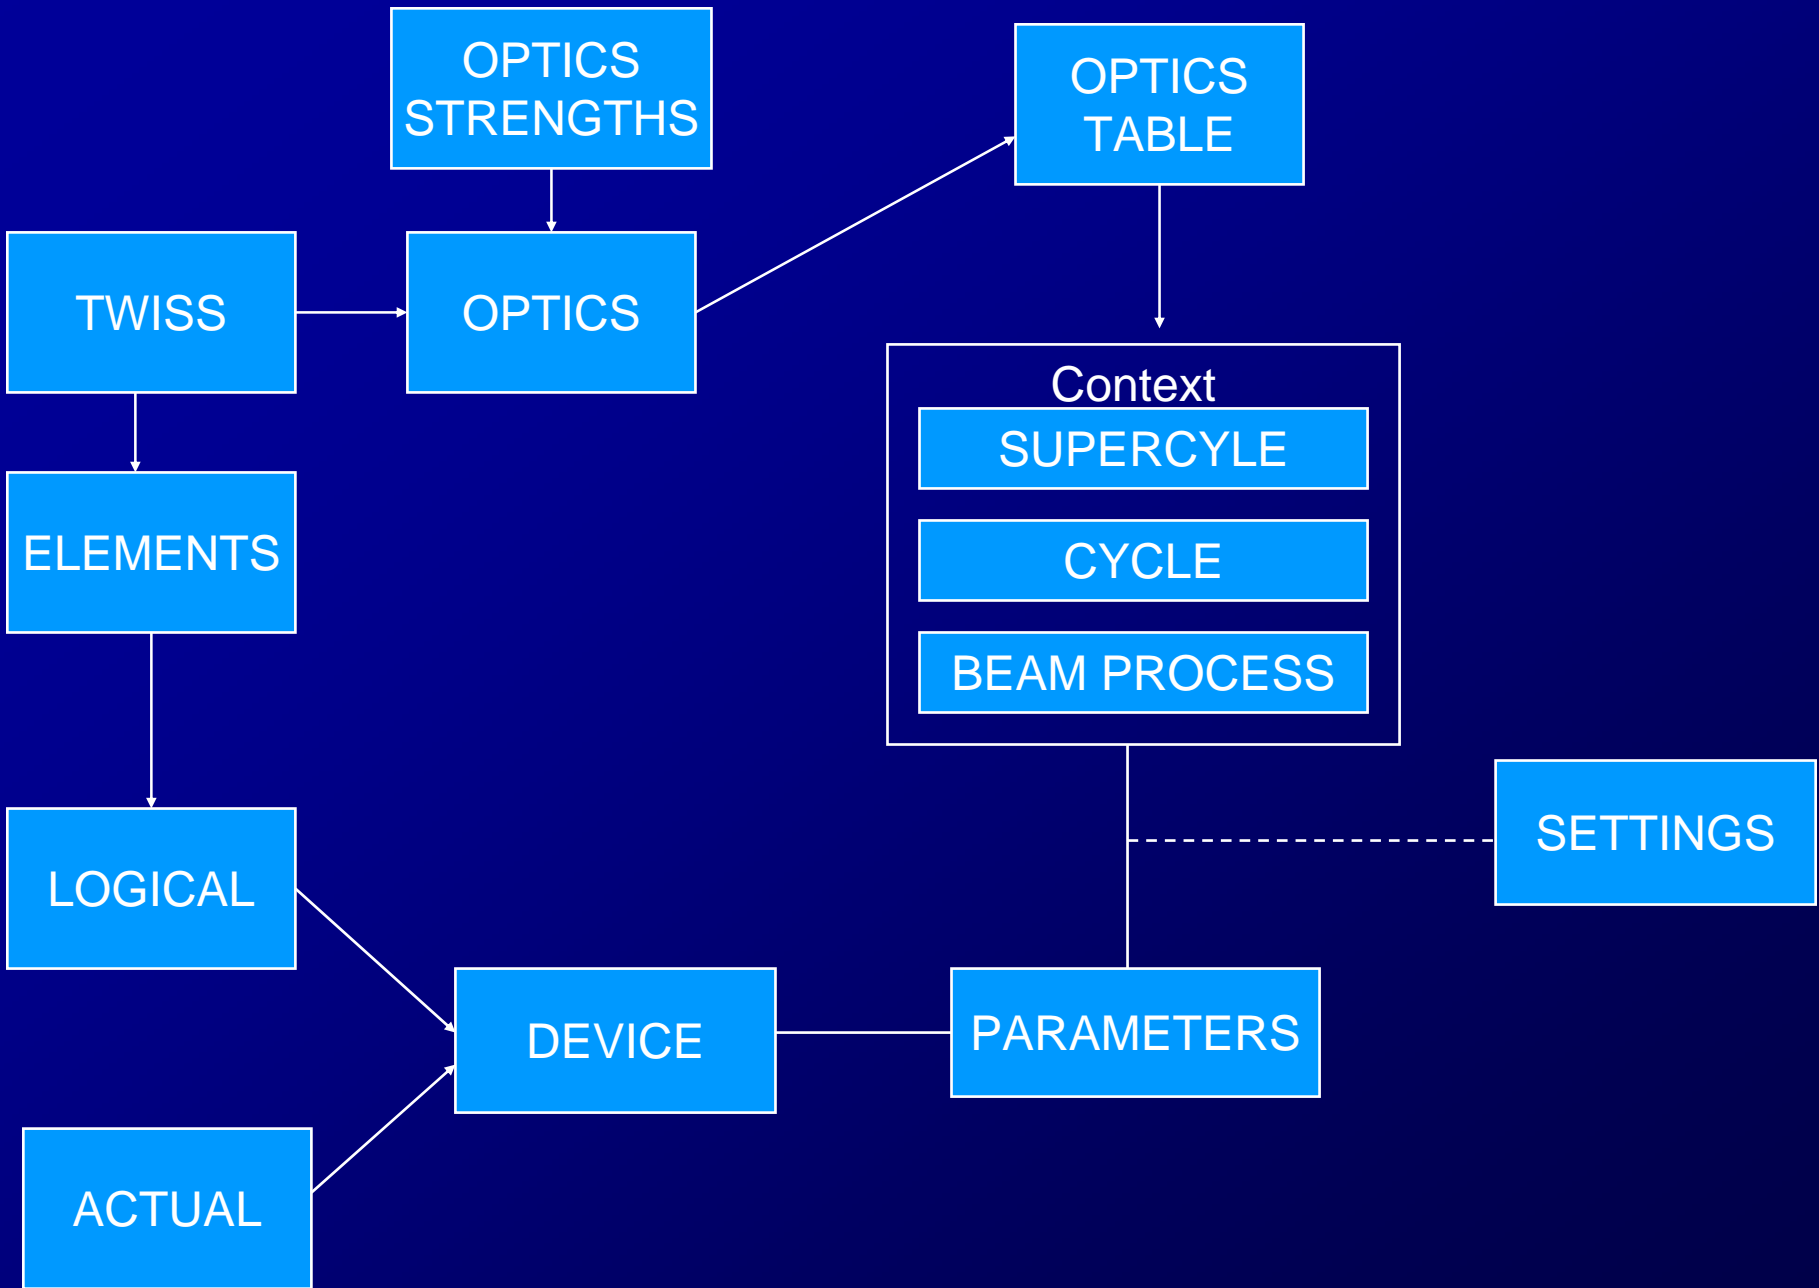

MAD

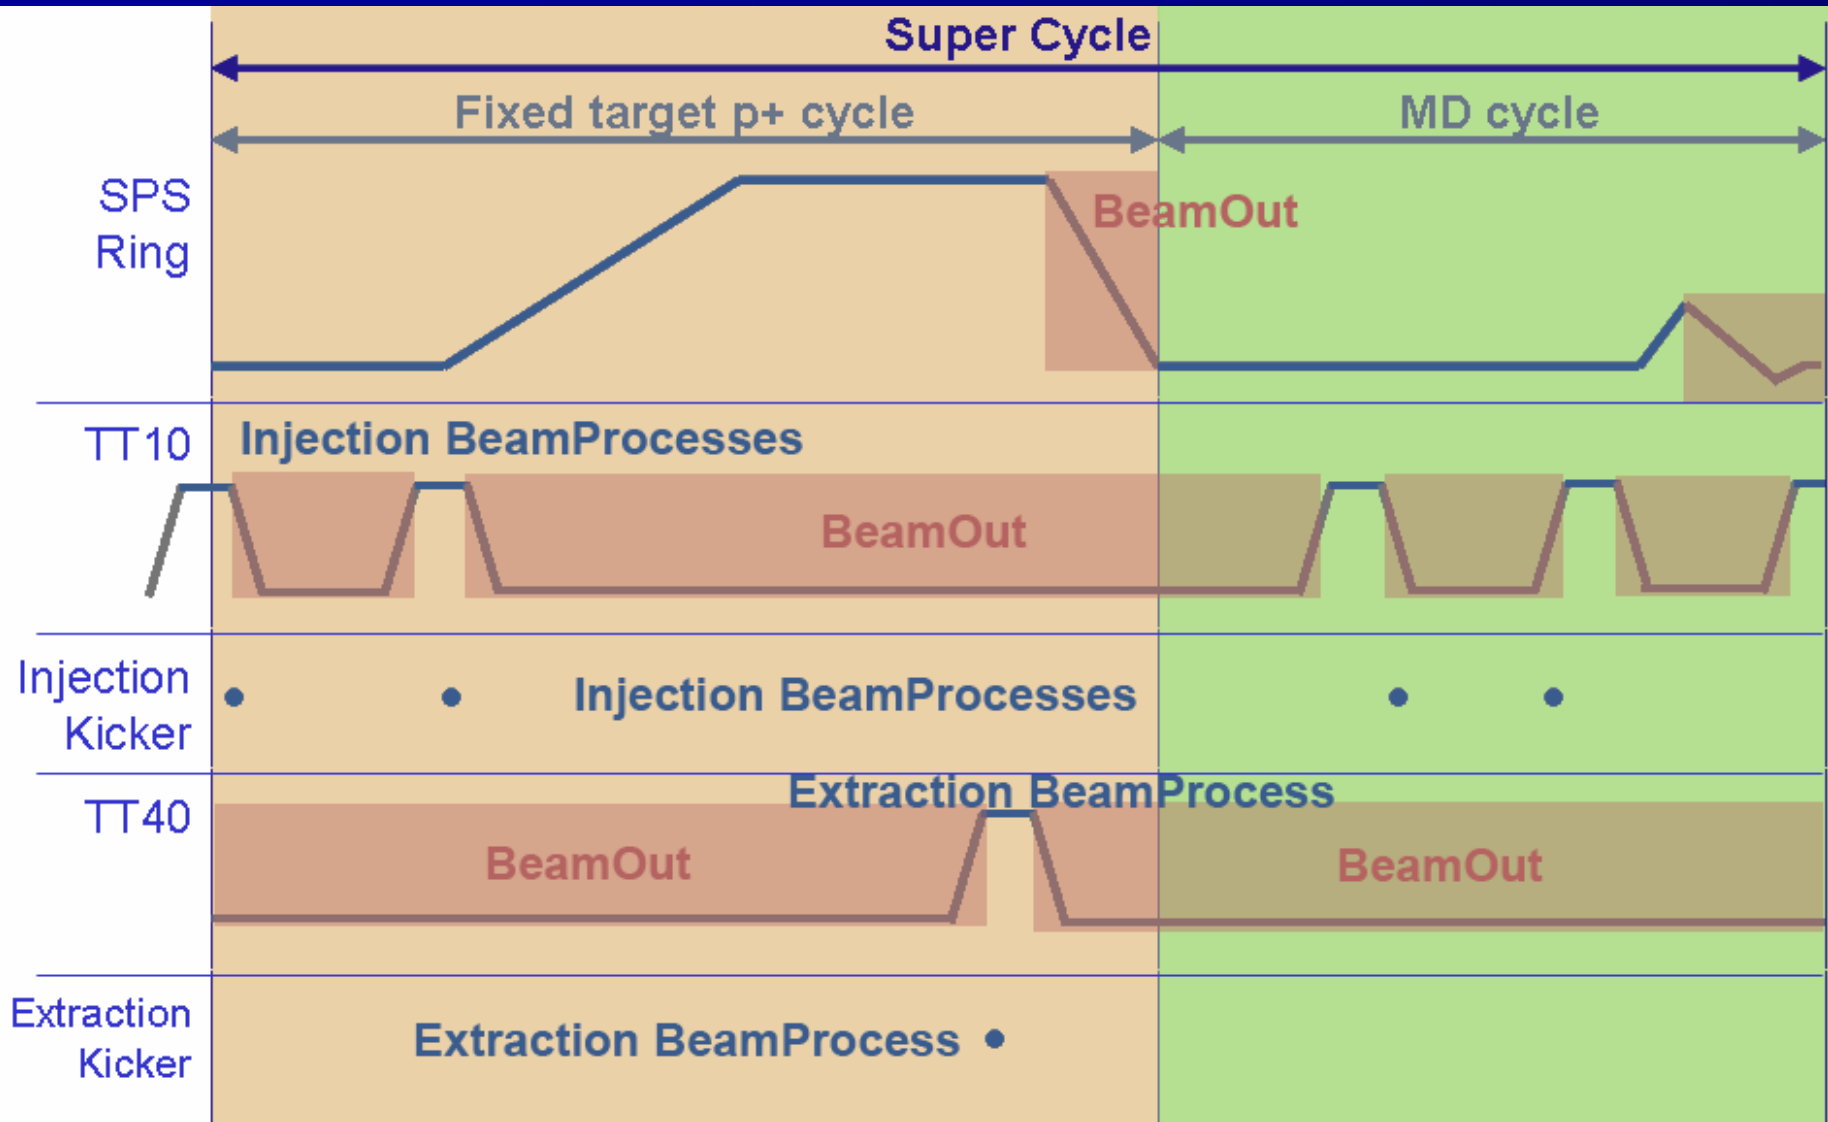

- **MAD sequences defined on the layout database**
- **Use MAD output for element configuration our side**
- **Perl looping over MAD executions and uploading optics to database**

Data Model

- ~ 120 tables
- Many iterations
- Years of experience and experimentations
- Fruitful collaboration with CO/DM
- Strong asset

Ack: Chris Roderick

**Database
configuration is key**

Rough Domain Breakdown

- Context configuration
- Optics
- Device/property configuration
- Parameter configuration
- Settings and trims
- Rules: make, link, incorporation

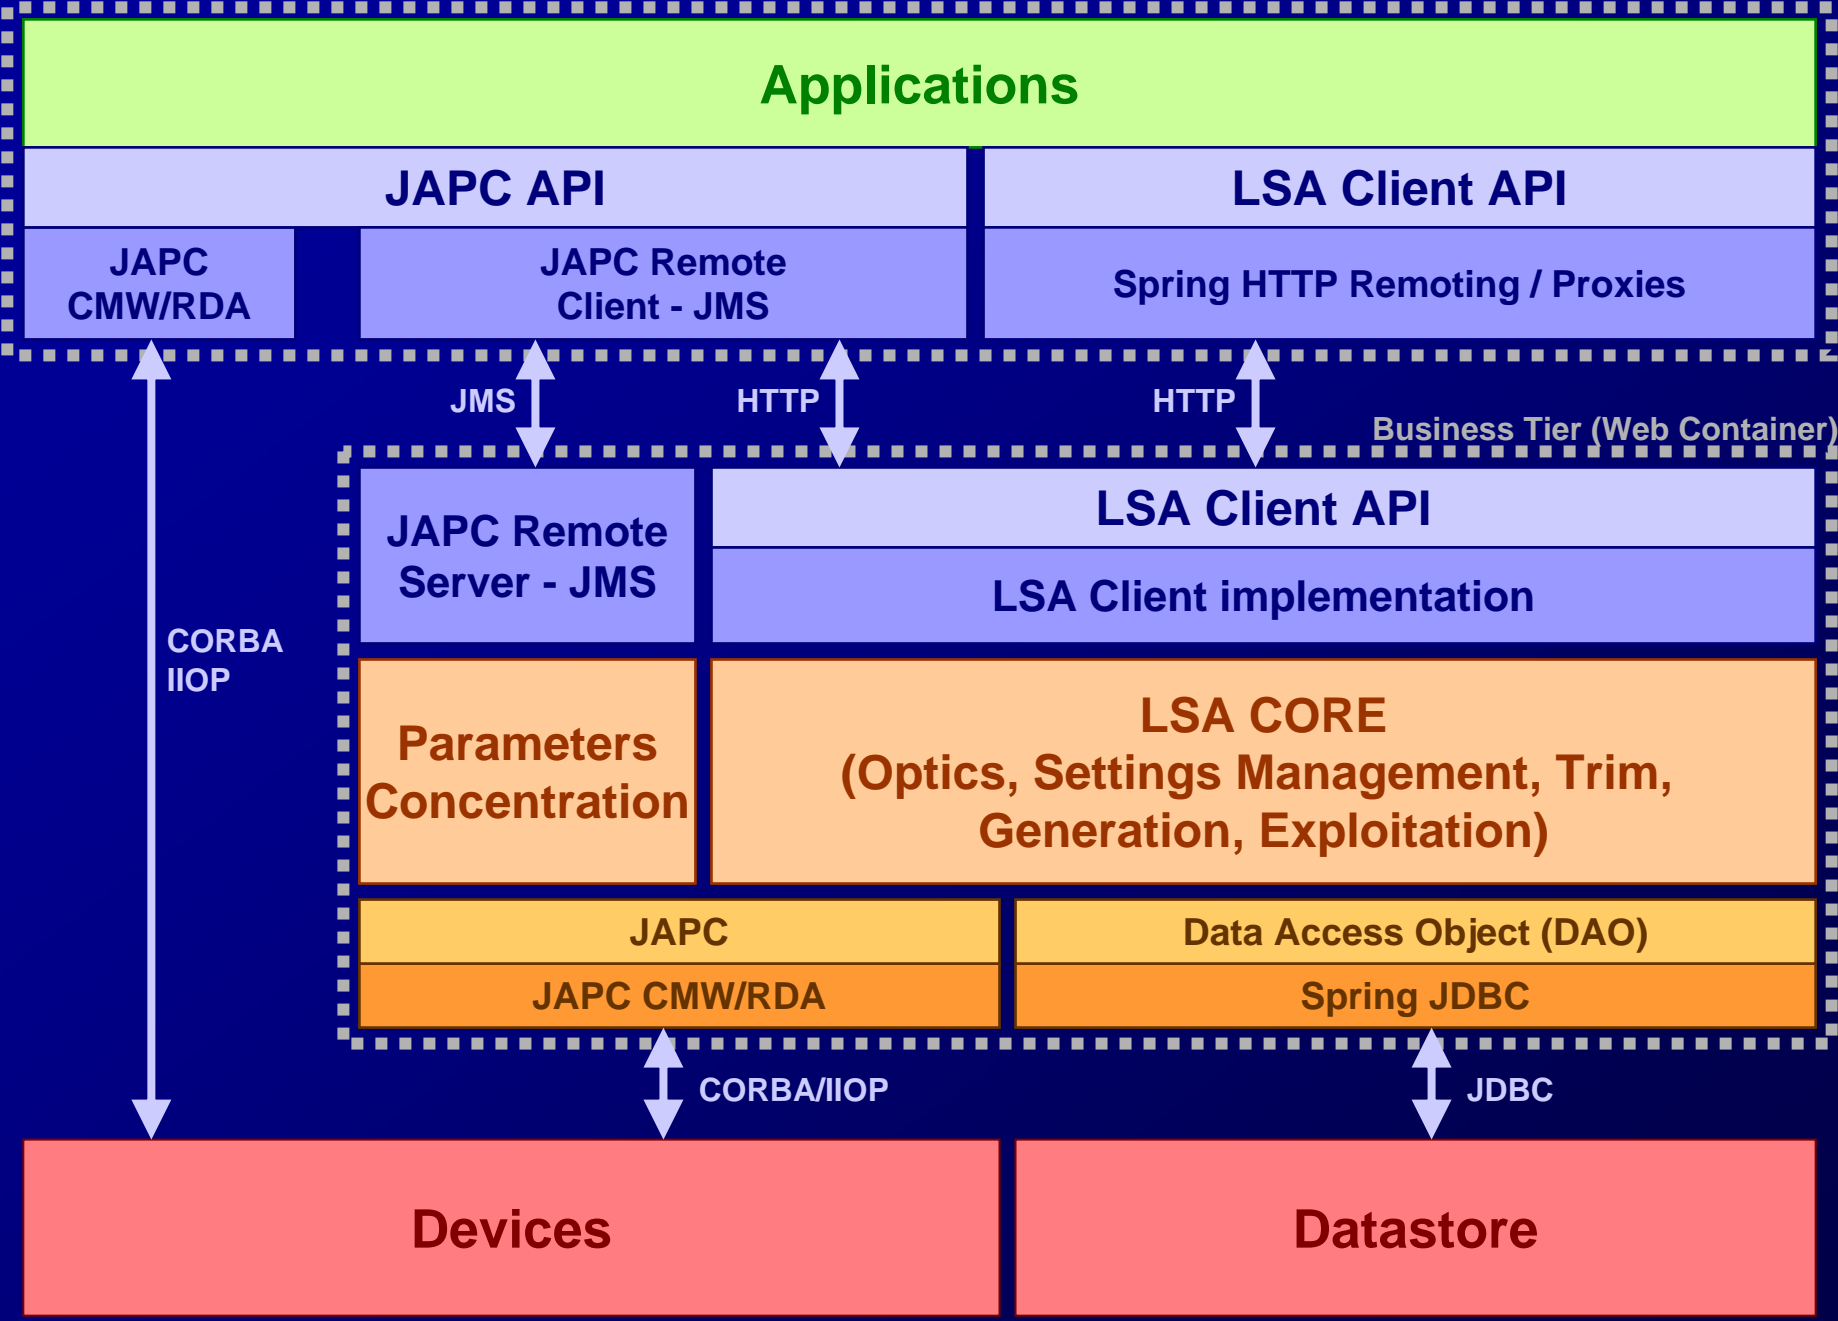

Core Software

- **Configuration and Optics**
- **Settings management**
 - **Operational, Critical and Expert**
- **Trim**
- **Settings Generation**
- **Exploitation**
- **Others Services**

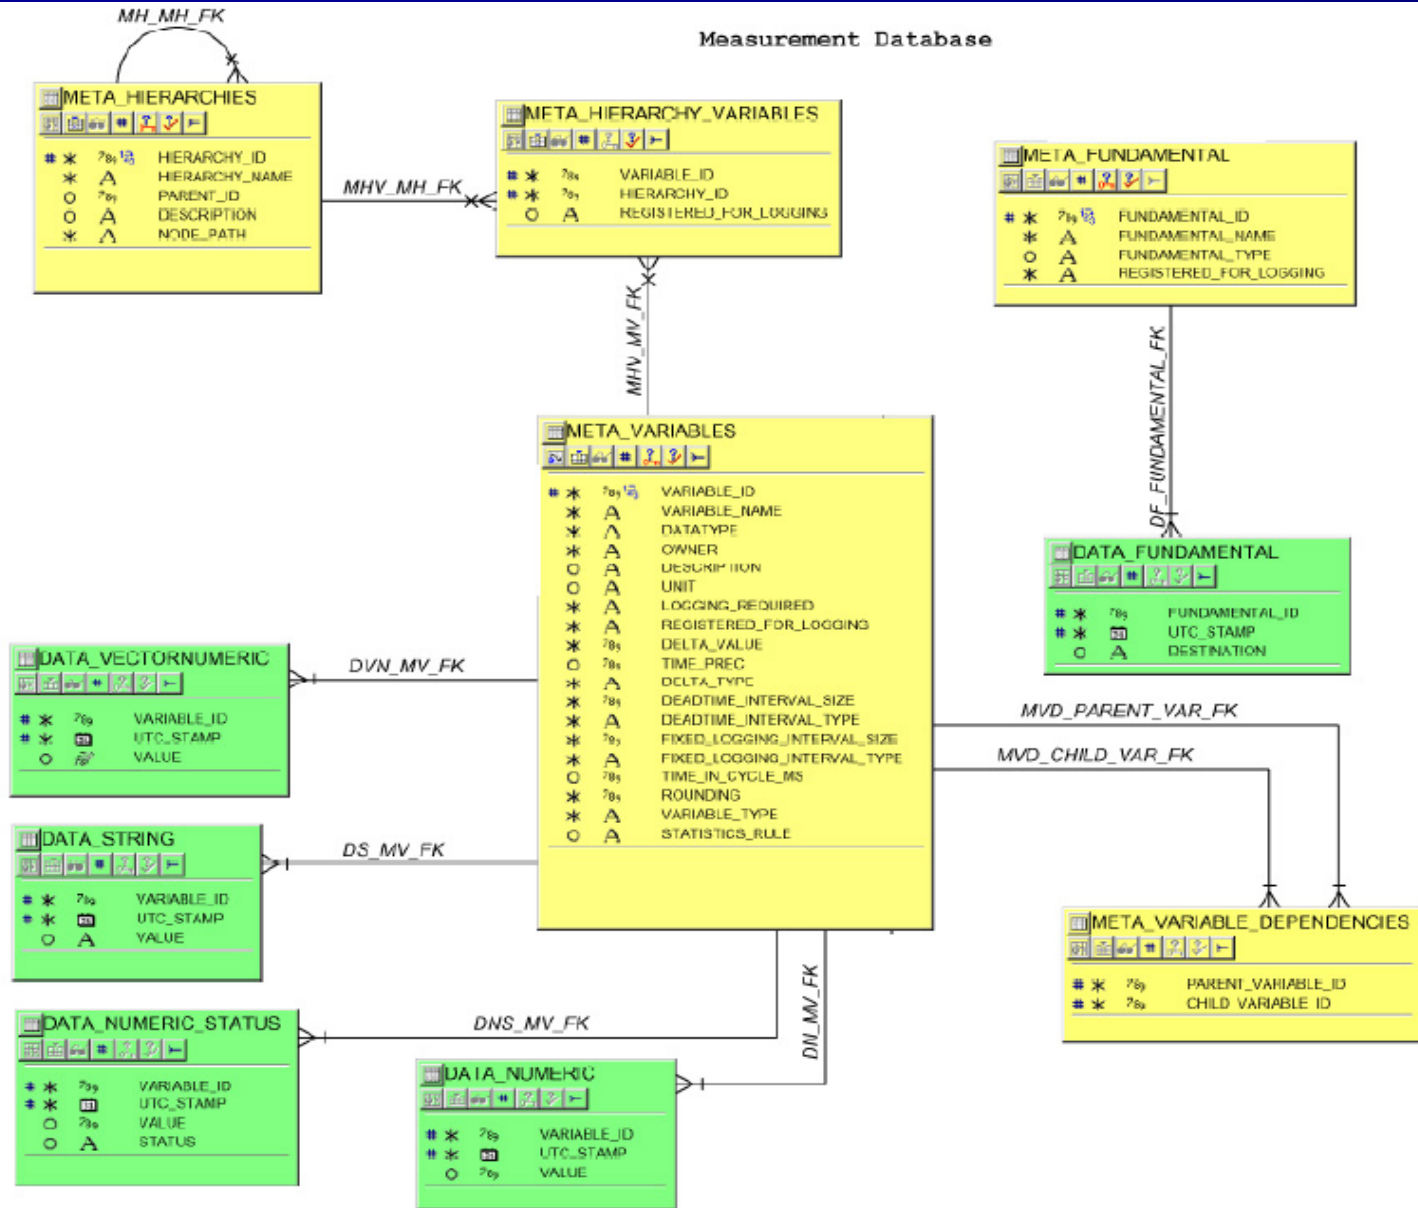

Modular

ARCHITECTURE

MEASUREMENT DB

Measurement Database

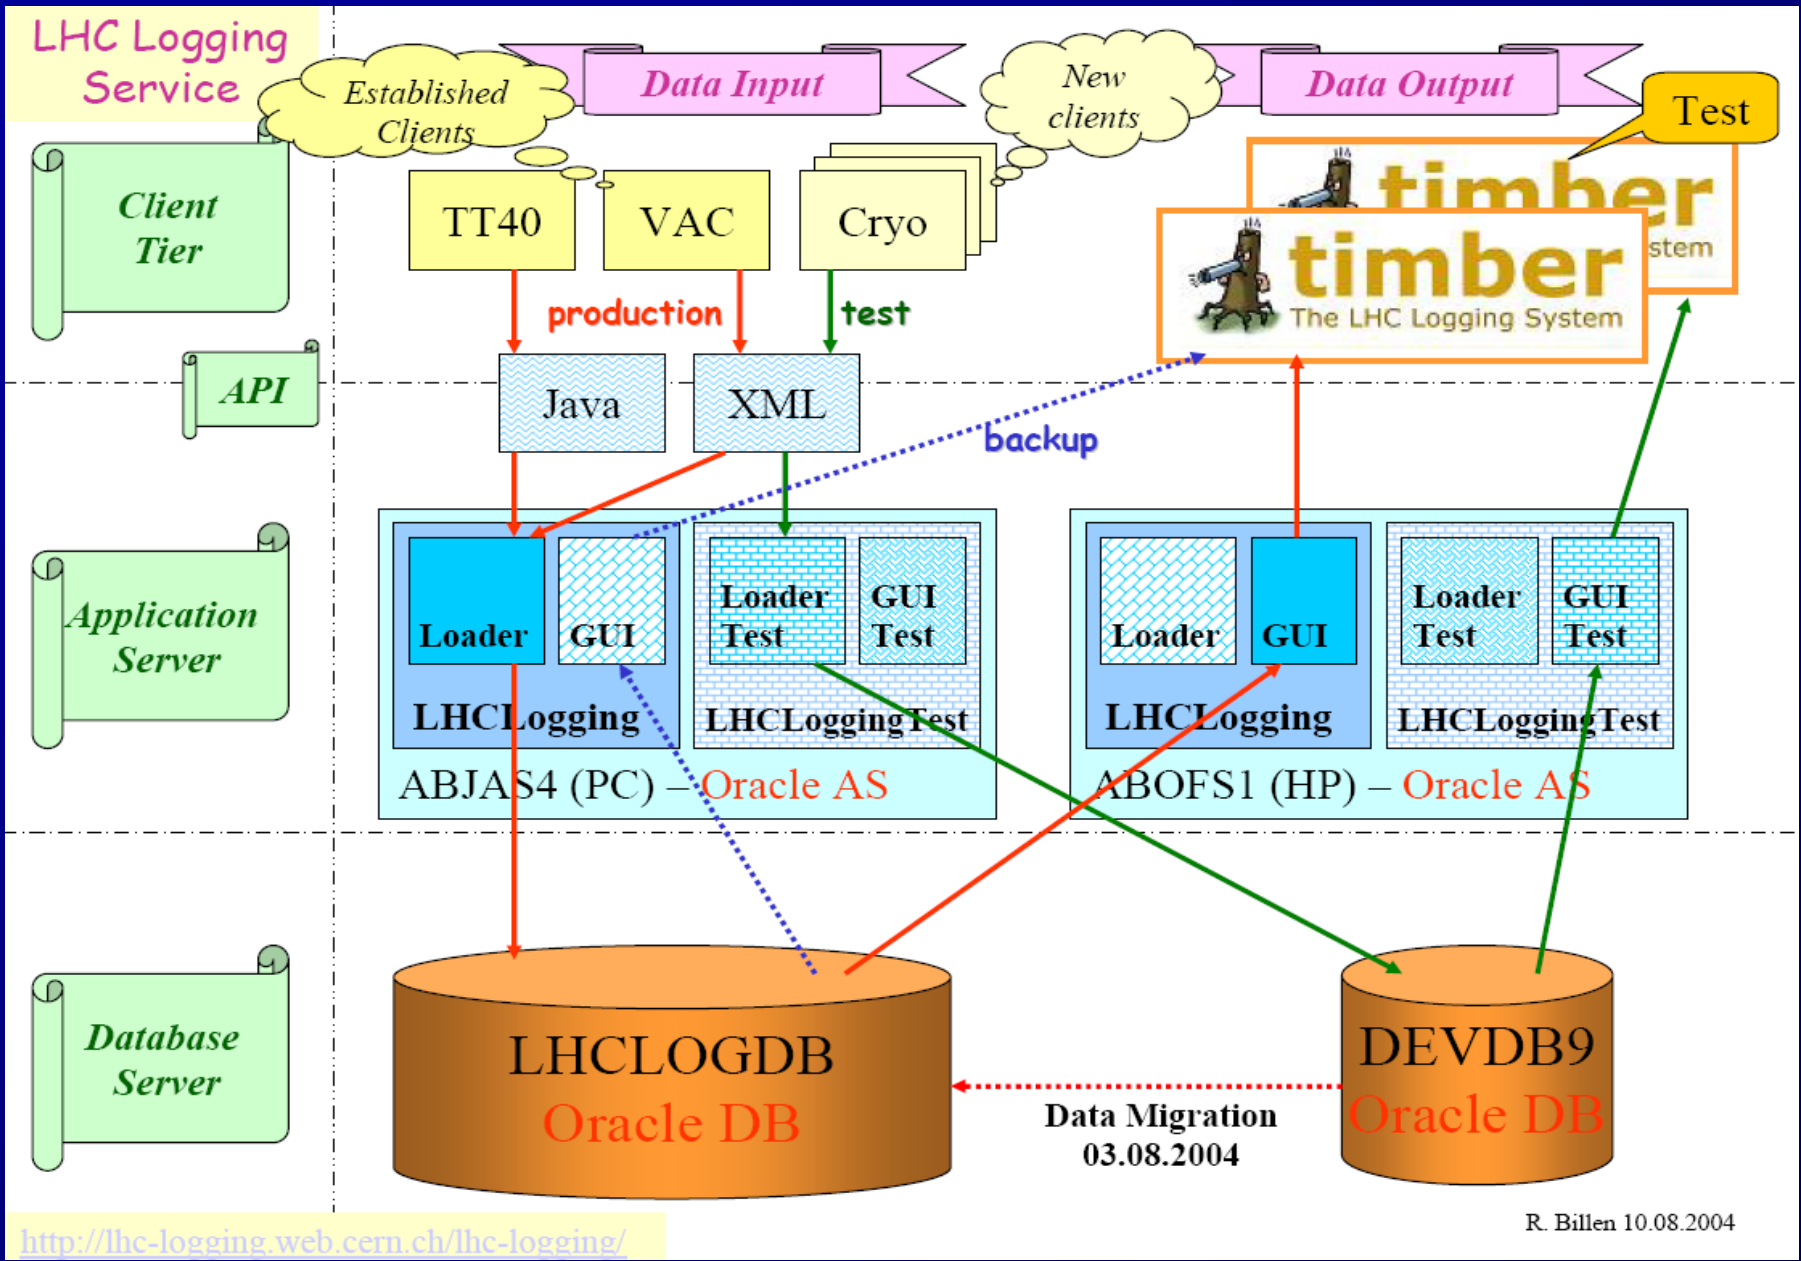

Measurement database

- Basically a holding pen for the logging database
- Up to 7 days data
- Filter and reduce before transfer to logging database

Logging

- **Dedicated database cluster (+1.5 Tbyte of disk space) on the production database LHCLOGDB.**
- **The LHC Logging Service is based on a 3-tier architecture; 2 machines are used to host the Application Server (middle) tier: ABJAS4 (a PC) and ABOFS1 (a Proliant HP), both with the Oracle Application Server installed and configured. In both AS, the dedicated OC4J containers “LHCLogging” are deployed**
- **Our clients implement an XML schema or use the Data Input API to submit their logging data to the service (as well as the meta data). This data loading chain is fully operational and in production, the Data Loading application on ABJAS4 takes care of the parsing and loading process.**
- **For Data Extraction, the web-deployed TIMBER interface allows users to get to selected logged variables, show them graphically and extract in file format.**

Conclusions

- **Off-line databases feeding...**
- **LSA on-line**
 - Well-developed data model which aims to be the sole repository for on-line control data
- **Measurements and Logging in place**
 - These are not a panacea
